

Electronic Tick and Flea Repeller

Scientific Documentation: Ultrasonic Measures (according to IRPA)

The sound pressure levels have been measured at various distances from the device. The maximum level observed was corresponding to 83.6 dB (at the stressed distance of only 1 cm!).

The level limit, referred to the frequency emitted by our electronic tick and flea repeller, is corresponding to 110 dB, as proposed by "Environmental Health Criteria on Ultrasound", edited by WHO.

Consequently, this is to certify that our electronic tick and flea repeller complies with the specifications.
